Version 1.8.15

github.com/SDevTutors/apocalypse-reveal-js

About this demo

- Every slide shows one thing ARJ adds to reveal.js
- Getting around: → for the next topic, ↓ for the slides in it. The contents button, bottom left, opens the contents; type a number and press Enter to jump to it
- Top right: the padlock, the pen, blackout, all slides, full screen and exit
- Version 1.8.15 is year.tenth.change: the year (1 is 2026), which tenth of the year (0 to 9), and one more for every change in that tenth, from 1

(1) Links

- A website's own icon before each link. ARJ brings two, reveal.js and GitHub; a deck adds its own in its CSS, like Wikipedia here (`a[href*="wikipedia.org"]::before`)
- Links to other websites open in a new tab (`linkIcons: { newTab: true }`), marked with an arrow out of a box, so the slides stay open
- A site without its own icon gets a plain link icon: jsDelivr
- A file on GitHub shows its type, in the code font: `readme.md`, `index.html`, `arj.css`, `deck.js`, `version.py`; a folder, arj/img/
- Links to slides in the deck stay in this tab: the code box

(2) The padlock

- Locked: the mouse changes slides (left click on, right click back, the wheel one slide), and text can't be selected
- Unlocked: select and copy text; the mouse stays on this slide
- Links, buttons and copy icons work either way

(2.1) A stack of slides

The grey bars under the heading are the slides in this stack; the gold one is this slide. Click a bar to go to its slide.

(3) Installing ARJ

- From jsDelivr: nothing to install, works on GitHub Pages
- With npm: needs Node.js, and `node_modules/` in `.gitignore`
- From a zip: copy the `arj` folder next to the deck
- Down for the code to copy. All of it: `docs/install.md`

(3.1) From jsDelivr

Nothing to install. In the deck's HTML:

```
<link rel="stylesheet" href="https://cdn.jsdelivr.net/npm/apocalypse-reveal-j
<link rel="stylesheet" href="https://cdn.jsdelivr.net/npm/apocalypse-reveal-j
<script src="https://cdn.jsdelivr.net/npm/apocalypse-reveal-js@1.8.15/arj/js/
```

Change `1.8.15` to move to a new version.

(3.2) With npm

Needs Node.js. In the top folder of the deck's repository:

```
npm install apocalypse-reveal-js@1.8.15
```

Add `node_modules/` to `.gitignore`; commit `package.json` and `package-lock.json`.

(3.3) With npm: the deck

A deck two folders down (`docs/memes/`) goes up two:

```
<link rel="stylesheet" href="../../node_modules/apocalypse-reveal-js/arj/css/
<link rel="stylesheet" href="../../node_modules/apocalypse-reveal-js/arj/css/
<script src="../../node_modules/apocalypse-reveal-js/arj/js/deck-start.js"></
```

GitHub Pages doesn't run npm: use jsDelivr for a published deck.

(3.4) From a zip

Download Source code (zip) from a release, copy its `arj` folder next to the deck, then:

```
<link rel="stylesheet" href="arj/css/arj.css" />
<link rel="stylesheet" href="arj/css/deck-controls.css" />
<script src="arj/js/deck-start.js"></script>
```

Commit the folder with the deck, and keep the `LICENSE` with it.

(4) A code box

The copy icon at the top right copies the code; it turns into a tick.

```
<script src="arj/js/deck-start.js"></script>
<script>
  startDeck({
    width: 1280, height: 720,
    lock: true,   // the padlock
    draw: true,   // the pen
    deckScripts: ['link-icons.js', 'deck-controls.js',
                  'deck.js', 'deck-draw.js', 'deck-search.js', 'deck-zoom.js'
  });
</script>
```

(5) Drawing

- Press the pen at the top right, or D. Draw, then press the pen again, or Esc
- The tools are at the top (`drawToolbar: 'top'`), clear of the slide number
- Only the slide can be drawn on: the rest goes grey, with a gold line round the slide
- Drawings stay with their slide until the page is reloaded
- A double click selects a word; it doesn't start drawing (`drawOnDoubleClick: false`)

(6) Search

- Press the magnifying glass at the top right, or Ctrl+F: it searches every slide, not just this one
- It searches as you type and counts the finds: "3 of 12"
- Enter or Down goes to the next find, on whichever slide it's on; Shift+Enter or Up to the one before
- The slide list shows each line with a find; click one to go to it
- Esc closes it. Try it: search for "draw"

(7) The slides as a PDF

- Download the PDF, already printed, one slide a page
- Or make your own: print version, then Save as PDF
